Swimming Pools, Spas, Hot Tubs, Fountains, and Similar Installations

INTRODUCTION TO ARTICLE 680—SWIMMING POOLS, SPAS, HOT TUBS, FOUNTAINS, AND SIMILAR INSTALLATIONS

The requirements contained in Article 680 apply to the installation of electrical wiring and equipment for swimming pools, hot tubs, spas, fountains, and hydromassage bathtubs. The overriding concern of Article 680 is to keep people and electricity separated.

This article is divided into seven parts. The various parts apply to certain types of installations, so be careful to determine which parts of this article apply to what and where. For instance, Part I and Part II apply to spas and hot tubs installed outdoors, except as modified in Part IV. In contrast, hydromassage bathtubs are only covered by Part VII. Read the details of this article carefully so you'll be able to provide a safe installation.

- **Part I—General.**
- **Part II—Permanently Installed Pools.** Installations at permanently installed pools must comply with both Parts I and II of this article.
- **Part III—Storable Pools.** Installations of storable pools must comply with Parts I and III of Article 680.
- **Part IV—Spas and Hot Tubs.** Spas and hot tubs must comply with Parts I and IV of this article; outdoor spas and hot tubs must also comply with Part II in accordance with 680.42.
- **Part V—Fountains.** Parts I and II apply to permanently installed fountains. If they have water in common with a pool, Part II also applies. Self-contained, portable fountains are covered by Article 422, Parts II and III.
- **Part VI—Pools and Tubs for Therapeutic Use.** Parts I and VI apply to pools and tubs for therapeutic use in health care facilities, gymnasiums, athletic training rooms and similar installations. If they’re portable appliances then Article 422, Parts II and III apply.
- **Part VII—Hydromassage Bathtubs.** Part VI applies to hydromassage bathtubs, but no other parts of Article 680 do.

PART I. GENERAL REQUIREMENTS FOR POOLS, SPAS, HOT TUBS, AND FOUNTAINS

**Author's Comment:** The requirements contained in Part I of Article 680 apply to permanently installed pools [680.20], storable pools [680.30], outdoor spas and hot tubs [680.42], and fountains [680.50].

**680.1 Scope.** The requirements contained in Article 680 apply to the installation of electric wiring and equipment for swimming pools, hot tubs, spas, fountains, and hydromassage bathtubs.

**680.2 Definitions.**

*Dry-Niche Luminaire.* A luminaire intended for installation in the floor or wall of a pool, spa, or fountain in a niche that's sealed against the entry of water.

*Forming Shell.* A structure mounted in the wall of permanently installed pools, storable pools, outdoor spas, outdoor hot tubs, or fountains designed to support a wet-niche luminaire.

*Fountain.* An ornamental pool, display pool, or reflection pool.
Hydromassage Bathtub. A permanently installed bathtub with a recirculating piping system designed to accept, circulate, and discharge water after each use.

Low Voltage Contact Limit. A voltage not exceeding the following values:

1. 15V (RMS) for sinusoidal ac
2. 21.20V peak for nonsinusoidal ac
3. 30V for continuous dc
4. 12.40V peak for dc that is interrupted at a rate of 10 to 200 Hz.

Maximum Water Level. The highest level that water reaches before it spills out. Figure 680–1

Figure 680–1

Permanently Installed Swimming, Wading, Immersion, and Therapeutic Pools. Those constructed in the ground or partially in the ground, and all others capable of holding water in a depth greater than 42 in., and pools installed inside of a building, regardless of water depth, whether or not served by electrical circuits of any nature.

Author’s Comment: The definition of a pool includes Baptisteries (immersion pools), which must comply with the requirements of Article 680.

Swimming Pools, Spas, Hot Tubs, Fountains, and Similar Installations

Pool. Manufactured or field-constructed equipment designed to contain water on a permanent or semipermanent basis and used for swimming, wading, immersion, or other purposes.

Spa or Hot Tub. A hydromassage pool or tub designed for recreational use typically not drained after each use.

Storable Swimming Pool. An aboveground pool with a maximum water depth of 42 in. Figure 680–2

Figure 680–2

Author’s Comment: Storable pools are sold as a complete package that consists of the pool walls, vinyl liner, plumbing kit, and pump/filter device. Underwriters Laboratories, Inc. (UL) requires the pump/filter units to have a minimum 25 ft cord to discourage the use of extension cords.

Wet-Niche Luminaire. A luminaire intended to be installed in a forming shell where the luminaire will be completely surrounded by water.

680.3 Other Articles. The wiring of permanently installed pools, storable pools, spas, hot tubs, or fountains must comply with Chapters 1 through 4, except as modified by this article. Figure 680–3

680.7 Cord-and-Plug-Connected Equipment. Fixed or stationary equipment other than an underwater luminaire for permanently installed pools can be cord-and-plug-connected to facilitate removal or disconnection for maintenance or repair.

(A) Length. Except for storable pools, the cord must not exceed 3 ft.

Author’s Comment: The NEC doesn’t specify a maximum cord length for a storable pool pump motor.
Swimming Pools, Spas, Hot Tubs, Fountains, and Similar Installations

Other Articles
680.3
Wiring for pools, spas, hot tubs, and fountains must comply with the requirements of the NEC Chapters 1 through 4, except as modified by Article 680.

Figure 680–3

(B) Equipment Grounding Conductor. The cord must have a copper equipment grounding conductor not smaller than 12 AWG and the cord must terminate at a grounding-type attachment plug.

680.8 Overhead Conductor Clearance. Overhead conductors must meet the clearance requirements contained in Table 680.8. The clearance is measured from the maximum water level.

(A) Overhead Power Conductors. Permanently installed pools, storable pools, outdoor spas, outdoor hot tubs, fountains, diving structures, observation stands, towers, or platforms must not be placed within the clearances contained in the NEC, Table 680.8. Figure 680–4

Figure 680–4

Author's Comment: This rule doesn’t prohibit utility-owned overhead service-drop conductors from being installed over a permanently installed pool, storable pool, outdoor spa, outdoor hot tub, or fountain [90.2(B)(5)]. It does prohibit a permanently installed pool, storable pool, outdoor spa, outdoor hot tub, or fountain from being installed under an existing service drop that isn’t at least 22½ ft above the water.

(B) Communications Systems. Permanently installed pools, storable pools, outdoor spas, outdoor hot tubs, fountains, diving structures, observation stands, towers, or platforms must not be placed under, or within, 10 ft of communications cables. Figure 680–5

Figure 680–5

Author's Comment: This rule doesn’t prohibit a utility-owned communications overhead cable from being installed over a permanently installed pool, storable pool, outdoor spa, outdoor hot tub, or fountain [90.2(B)(4)]. It does prohibit a permanently installed pool, storable pool, outdoor spa, outdoor hot tub, or fountain from being installed under an existing communications utility overhead supply that isn’t at least 10 ft above the water.

680.9 Electric Water Heater. The ampacity of branch-circuit conductors and overcurrent devices for pool or outdoor spa and hot tub water heaters must not be less than 125 percent of the total nameplate rating. Figure 680–6

Figure 680–6

Mike Holt Enterprises, Inc. • www.MikeHolt.com • 888.NEC.CODE (632.2633)
680.10 Underground Wiring. Underground wiring isn't permitted under permanently installed pools or within 5 ft horizontally from the inside wall of the pool unless necessary to supply the permanently installed pool or storable pool. Figure 680–7

If space limitations prevent underground wiring from being at least 5 ft away, wiring must be installed in complete raceway systems of rigid metal conduit, intermediate metal conduit, or PVC conduit. Figure 680–8

The minimum cover is 6 in for rigid metal conduit, intermediate metal conduit and nonmetallic raceways with 4 in. of concrete cover and 18 in. of cover for nonmetallic raceways without concrete cover (Table 680.10).

680.11 Equipment Rooms and Pits. A permanently installed pool, storable pool, outdoor spa, outdoor hot tub, or fountain equipment must not be located in rooms or pits that don't have adequate drainage to prevent water accumulation during normal operation or filter maintenance.

680.12 Maintenance Disconnecting Means. A maintenance disconnecting means is required for the permanently installed pool, storable pool, outdoor spa, outdoor hot tub, or fountain equipment, other than lighting for these water bodies.

The maintenance disconnecting means must be readily accessible and located within sight and at least 5 ft from the permanently installed pool, storable pool, outdoor spa, outdoor hot tub, or fountain equipment unless separated from the open water by a permanently installed barrier that provides a 5 ft reach path or greater. This horizontal distance is measured from the water's edge along the shortest path required to reach the disconnecting means. Figure 680–9

Author's Comment: According to Article 100, within sight means that it's visible and not more than 50 ft from one to the other.
PART II. PERMANENTLY INSTALLED POOLS, OUTDOOR SPAS, AND OUTDOOR HOT TUBS

680.20 General. The installation requirements contained in Part I and Part II apply to permanently installed pools [680.20], outdoor spas, and outdoor hot tubs [680.42].

680.21 Motors.

(A) Wiring Methods. The wiring to a motor must comply with (A)(1) unless modified by (A)(2), (A)(3), (A)(4), or (A)(5). Figure 680-10

(1) General. Branch-circuit conductors for permanently installed pool, outdoor spa, and outdoor hot tub motors must be installed in rigid metal conduit, intermediate metal conduit, PVC conduit, or Type MC cable listed for the location (sunlight-resistant or for direct burial). The wiring methods must contain an insulated copper equipment grounding conductor sized in accordance with 250.122, but in no case can it be smaller than 12 AWG.

(2) On or Within Buildings. If installed on or within buildings, electrical metallic tubing is permitted to supply permanently installed pool, outdoor spa, and outdoor hot tub motors.

Author's Comment: If electrical metallic tubing is used, it must contain an insulated copper equipment grounding conductor as required by 680.21(A)(1).

(3) Flexible Connections. Liquidtight flexible metal or liquidtight flexible nonmetallic conduit is permitted for permanently installed pool, outdoor spa, and outdoor hot tub motors.

Author's Comment: If liquidtight flexible metal or liquidtight flexible nonmetallic conduit is used, it must contain an insulated copper equipment grounding conductor as required by 680.21(A)(1).

(4) One-Family Dwelling. In the interior of a dwelling unit or accessory building associated with a dwelling unit, any Chapter 3 wiring method is permitted. If branch-circuit conductors are installed in a raceway, the wiring method must contain an insulated copper equipment grounding conductor as required by 680.21(A)(1). If a cable assembly is used, the circuit equipment grounding conductor can be uninsulated. Figure 680-11

(5) Cord-and-Plug Connections. A cord no longer than 3 ft, with an attachment plug and containing a copper equipment grounding conductor, sized in accordance with 250.122, but not smaller than 12 AWG is permitted for pool associated motors. Figure 680-12

Author's Comment: For outdoor spas and hot tubs, the cord must be GFCI protected and it can be up to 15 ft long [680.42(A)(2)].

(C) GFCI Protection. GFCI protection is required for outlets supplying pool pump motors connected to single-phase 120V through 240V branch circuits rated 15A or 20A, whether by receptacle or by direct connection. Figure 680-13
680.22 Lighting, Receptacles, and Equipment.

(A) Receptacles.

(1) Circulation System. Receptacles for a permanently installed pool, outdoor spa, and outdoor hot tub motors, or other loads directly related to the circulation system must be located not less than 10 ft from the inside walls of a permanently installed pool, outdoor spa, or outdoor hot tub, or not less than 6 ft from the inside walls of a permanently installed pool, outdoor spa, or outdoor hot tub if they meet all of the following conditions: Figure 680–14

(1) Consist of a single receptacle

(2) Employ a locking configuration

(3) Be of the grounding type

(4) Have GFCI protection

(2) Other Receptacles. Receptacles not for motors or other loads directly related to the circulation system must be not less than 6 ft from the inside walls of a permanently installed pool, outdoor spa, or outdoor hot tub. Figure 680–15

(3) Dwelling Unit. At a dwelling unit, one 15A or 20A, 125V receptacle must be located not less than 6 ft and not more than 20 ft from the inside walls of a permanently installed pool, outdoor spa, or outdoor hot tub. This receptacle must be located not more than 6½ ft above the floor, platform, or grade level serving the permanently installed pool, outdoor spa, or outdoor hot tub. Figure 680–16
(4) GFCI-Protected Receptacles. 15A and 20A, 125V receptacles located within 20 ft from the inside walls of a permanently installed pool, outdoor spa, or outdoor hot tub must be GFCI protected. Figure 680–17

Author’s Comments:
- Outdoor dwelling unit receptacles must be GFCI protected, regardless of the distance from a permanently installed pool, outdoor spa, or outdoor hot tub [210.8(A)(3)].
- All 15A and 20A, 125V receptacles for nondwelling units located outdoors require GFCI protection [210.8(B)(4)].

(5) Measurements. The receptacle distance is measured as the shortest path an appliance cord would follow without passing through a wall, doorway, or window.

(B) Luminaires and Ceiling Fans.

(1) New Outdoor Installations. Luminaires and ceiling fans installed above the water, or the area extending within 5 ft horizontally from the inside walls of a permanently installed pool, outdoor spa, or outdoor hot tub, must not be less than 12 ft above the maximum water level.

(3) Existing Installations. Existing luminaires located less than 5 ft horizontally from the inside walls of a permanently installed pool, outdoor spa, or outdoor hot tub must not be less than 5 ft above the surface of the maximum water level and must be GFCI protected. Figure 680–18

(4) Adjacent Areas. New luminaires installed between 5 ft and 10 ft horizontally, and not more that 5 ft above the maximum water level of a permanently installed pool, outdoor spa, or outdoor hot tub must be GFCI protected.

Author’s Comment: Low-voltage lighting systems must not be located within 10 ft of a pool, spa, or hot tub, even if GFCI protected [411.4]. Figure 680–19

(C) Switching Devices. Circuit breakers, time clocks, pool light switches, and other switching devices must be located not less than 5 ft horizontally from the inside walls of a permanently installed pool, outdoor spa, or outdoor hot tub unless separated by a solid fence, wall, or other permanent barrier. Figure 680–20
**680.23 Underwater Luminaires.**

(A) General.

(2) Transformers and Power Supplies. Transformers and power supplies for underwater luminaires must be listed.

(3) GFCI Protection of Underwater Luminaires, Relamping. Branch circuits that supply underwater luminaires operating at more than 15V for sinusoidal alternating current, 21.20V peak for nonsinusoidal alternating current, 30V for continuous direct current, and 12.40V peak for direct current interrupted at a rate of 10 to 200 Hz or less [680.2 Low-Voltage Contact Limit] must be GFCI protected. **Figure 680–21**

(E) Other Outlets. Other outlets must not be located less than 10 ft from the inside walls of a permanently installed pool, outdoor spa, or outdoor hot tub. The receptacle distance is measured as the shortest path an appliance cord would follow without passing through a wall, doorway, or window [680.21(A)(5)].

Note: Examples of other outlets may include remote-control, signaling, fire alarm, and communications circuits.
(5) **Wall-Mounted Luminaires.** Underwater luminaires must be installed so that the top of the luminaire lens isn't less than 18 in. below the normal water level.

(B) **Wet-Niche Underwater Luminaires.**

(1) **Forming Shells.** Forming shells for wet-niche underwater luminaires must be equipped with provisions for raceway entries. All forming shells used with PVC conduit systems must include provisions for terminating an 8 AWG copper conductor.

(2) **Wiring to the Forming Shell.** The raceway that extends directly to the underwater pool wet-niche forming shell must comply with (a) or (b).

(a) **Metal Raceway.** Brass or corrosion-resistant rigid metal conduit approved by the authority having jurisdiction.

(b) **Nonmetallic Raceway.** A nonmetallic raceway containing an 8 AWG insulated (solid or stranded) copper bonding jumper must terminate in the forming shell and junction box. **Figures 680–22**

(Figure 680–22)

The termination of the 8 AWG bonding jumper in the forming shell must be covered with a listed potting compound to protect the connection from the possible deteriorating effect of pool water.

(6) **Servicing.** The forming shell location and length of cord in the forming shell must allow for personnel to place the removed luminaire on the deck or other dry location for maintenance. The luminaire maintenance location must be accessible without entering or going in the pool water. **Figure 680–23**

(Figure 680–23)

**Author’s Comment:** While it may be necessary to enter the pool water, possibly with underwater breathing apparatus in some cases, the cord must be long enough to allow the luminaire to be brought out and placed on a deck or other dry location where the relamping, maintenance, or inspection can take place without entering the pool water.

(F) **Branch-Circuit Wiring.**

(1) **Wiring Methods.** Branch-circuit wiring for underwater luminaires must be rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or PVC conduit [680.23(B)(2)].

If installed on buildings, electrical metallic tubing is permitted, and where installed within buildings, electrical nonmetallic tubing, Type MC cable, electrical metallic tubing, or Type AC cable is permitted. The wiring methods must contain an insulated copper equipment grounding conductor sized in accordance with 250.122, but in no case can it be smaller than 12 AWG.

**Ex:** If connecting to transformers for pool lights, liquidtight flexible metal conduit is permitted in individual lengths not exceeding 6 ft.
(2) Equipment Grounding Conductor. For other than listed low-voltage luminaires not requiring grounding, branch-circuit conductors for an underwater luminaire must contain an insulated copper equipment grounding conductor sized in accordance with 250.122, but not smaller than 12 AWG, Figure 680–24. The circuit equipment grounding conductor for the underwater luminaire must not be spliced, except as permitted in (a) or (b).

![Figure 680–24](Image)

680.24 Junction Box, Transformer, or GFCI Enclosure.

(A) Junction Box. The junction box (deck box) that connects directly to an underwater permanently installed pool, outdoor spa, or outdoor hot tub luminaire forming shell must comply with the following:

(1) Construction. The junction box must be listed as a swimming pool junction box, Figure 680–25, and must be:

![Figure 680–25](Image)

(a) If more than one underwater luminaire is supplied by the same branch circuit, the circuit equipment grounding conductor can terminate at a listed pool junction box that meets the requirements of 680.24(A).

(b) The circuit equipment grounding conductor can terminate at the grounding terminal of a listed pool transformer that meets the requirements of 680.23(A)(2).

(3) Conductors. The branch circuit conductors on the load side of a GFCI or transformer for underwater luminaires must not occupy raceways or enclosures containing other conductors unless one of the following conditions applies:

(1) The other conductors are GFCI protected.

(2) The other conductors are equipment grounding conductors.

(3) The other conductors are the supply conductors to a feed-through type GFCI.

(4) The GFCI-protected conductors are within a panelboard.

(1) Equipped with threaded entries or a nonmetallic hub,

(2) Constructed of copper, brass, or corrosion-resistant material approved by the authority having jurisdiction, and

(3) Provide electrical continuity between metal raceways and grounding terminals within the junction box.

Author’s Comment: In addition, the junction box must be provided with at least one more grounding terminal than the number of raceway entries [680.24(D)], and the junction box must have a strain relief for the cord [680.24(E)].
Swimming Pools, Spas, Hot Tubs, Fountains, and Similar Installations

(2) Installation. If the luminaire operates at over 15V for sinusoidal alternating current, 21.20V peak for nonsinusoidal alternating current, 30V for continuous direct current, and 12.40V peak for direct current interrupted at a rate of 10 to 200 Hz [680.2 Low Voltage Contact Limit], the junction box location must comply with (a) and (b). If the luminaire operates at 15V for sinusoidal alternating current, 21.20V peak for nonsinusoidal alternating current, 30V for continuous direct current, and 12.40V peak for direct current interrupted at a rate of 10 to 200 Hz or less [680.2 Low Voltage Contact Limit], a flush deck box is permitted if both of the following apply:

1. An approved potting compound prevents the entrance of moisture.
2. The flush deck box is located not less than 4 ft from the inside wall of the pool.

(b) Vertical Spacing. The junction box must be located not less than 4 in. above the ground or permanently installed pool deck, outdoor spa deck, or outdoor hot tub deck, or not less than 8 in. above the maximum water level, whichever provides the greater elevation.

(A) Transformer or GFCI Enclosure. If the enclosure for a transformer or GFCI is connected to a raceway that extends directly to an underwater permanently installed pool, outdoor spa, or outdoor hot tub luminaire forming shell, the enclosure must comply with the following:

1. Construction. The enclosure must be listed and labeled for the purpose, and be:
   1. Equipped with threaded entries or a nonmetallic hub,
   2. Constructed of copper, brass, or corrosion-resistant material approved by the authority having jurisdiction, and
   3. Provided with electrical continuity between metal raceways and grounding terminals of the enclosure.

   Author’s Comment: See the definitions of “Labeled” and “Listed” in Article 100.

(C) Physical Protection. Junction boxes for underwater pool, spa, or hot tub luminaires must not be located in the walkway unless afforded protection by being located under diving boards or adjacent to fixed structures.

(D) Equipment Grounding Terminals. The junction box for an underwater permanently installed pool, outdoor spa, or outdoor hot tub luminaire must be provided with at least one more grounding terminal than the number of raceway entries.

   Author’s Comment: Typically, there are four grounding terminals in the junction box and three raceway entries.

(E) Strain Relief. The termination of a flexible cord that supplies an underwater permanently installed pool, outdoor spa, or outdoor hot tub luminaire must be provided with a strain relief.
680.25 Feeders.

(A) Wiring Methods.

(1) Feeder conductors to panelboards containing a permanently installed pool, outdoor spa, or outdoor hot tub equipment circuits must be installed in rigid metal conduit or intermediate metal conduit. If not subject to physical damage, the following wiring methods are permitted: Figure 680–28

(a) Liquidtight flexible nonmetallic conduit

(b) PVC conduit

(d) Electrical metallic tubing where installed on or within a building

(e) Electrical nonmetallic tubing where installed within a building

(f) Type MC cable where installed within a building and not subject to a corrosive environment

Ex: Branch circuits for permanently installed pool, outdoor spa, or outdoor hot tub equipment can originate from an existing panelboard if the existing feeder contains an equipment grounding conductor within the outer sheath of a cable.

680.26 Equipotential Bonding.

Author’s Comment: The bonding requirements of this section do not apply to spas and hot tubs [680.42]

(A) Performance. Equipotential bonding is intended to reduce voltage gradients in the area around a permanently installed pool by the use of a common bonding grid in accordance with 680.26(B) and (C).

(B) Bonded Parts. The parts of a permanently installed pool listed in (B)(1) through (B)(7) must be bonded together with a solid copper conductor not smaller than 8 AWG with listed pressure connectors, terminal bars, exothermic welding, or other listed means [250.8(A)]. Figure 680–29

Equipotential bonding isn’t required to extend to or be attached to any panelboard, service equipment, or grounding electrode.
(1) Concrete Pool Shells.

(a) Structural Reinforcing Steel. Unencapsulated structural reinforcing steel in concrete shells secured together by steel tie wires. Figure 680–30

(2) Perimeter Surfaces. An equipotential bonding grid must extend 3 ft horizontally beyond the inside walls of a pool including unpaved, paved, and poured concrete surfaces, Figure 680–31. Perimeter surfaces less than 3 ft that are separated by a permanent wall or building 5 ft in height or more require an equipotential bonding grid on the pool side of the permanent wall or building.

Author’s Comment: The NEC doesn’t provide any guidance on the installation requirements for structural reinforcing steel when used as a perimeter equipotential bonding grid.
(b) Alternative Means. Where the structural reinforcing steel isn't available (or is encapsulated in a nonconductive compound, such as epoxy), an equipotential bonding grid meeting all of the following requirements must be installed: **Figure 680–33**

![Equipotential Bonding of Perimeter Surfaces Alternative Means - Copper Conductor Grid 680.26(B)(2)(b)](image)

- A minimum of 8 AWG solid copper must have at least four uniformly spaced connection points connected to the pool reinforcing steel.
- 18 to 24 in. From Inside Wall of Pool
- 8 AWG Bare Solid Copper
- Perimeter Surface

**Figure 680–33**

(6) Electrical Equipment. Metal parts of electrical equipment associated with the pool water circulating system, such as water heaters and pump motors and metal parts of pool covers must be bonded to the equipotential grid. **Figure 680–34**

![Bonded Parts Electrical Equipment 680.26(B)(6)](image)

- Metal parts of electrical equipment associated with the water circulating system must be bonded to the equipotential grid.

**Figure 680–34**

Ex: Metal parts of listed double-insulation equipment isn't required to be bonded to the equipotential grid.

(a) Double-Insulated Water-Pump Motors. If a double-insulated water-pump motor is installed, a solid 8 AWG copper conductor from the bonding grid must be provided for a replacement motor.

(b) Pool Water Heaters. Pool water heaters must be grounded and bonded in accordance with equipment instructions.

(7) Fixed Metal Parts. All fixed metal parts must be bonded to the equipotential grid, including but not limited to, metal-sheathed cables and raceways, metal piping, metal awnings, metal fences, metal door and window frames. **Figure 680–35**

Ex 1: If separated from the pool structure by a permanent barrier that prevents contact by a person.

Ex 2: If located more than 5 ft horizontally of the inside walls of the pool structure.

Ex 3: If located more than 12 ft measured vertically above the maximum water level.
680.27 Specialized Equipment.

(B) Electrically Operated Covers.

(1) Motors and Controllers. The electric motors, controllers, and wiring for an electrically operated cover must be located not less than 5 ft from the inside wall of a permanently installed pool, outdoor spa, or outdoor hot tub, unless separated by a permanent barrier.

(2) GFCI Protection. The electric motor and controller circuit must be GFCI protected.

PART III. STORABLE SWIMMING POOLS

680.30 General. Electrical installations for storable pools must also comply with Part I of Article 680.

Author's Comment: The requirements contained in Part I of Article 680 include the locations of switches, receptacles, and luminaires.

680.31 Pumps. Cord-connected pool pumps must be double insulated and have a means to ground the internal metal parts to an equipment grounding conductor installed with the power-supply conductors in the flexible cord. The cord must also have GFCI protection as an integral part of the attachment plug. Figure 680–37

Author's Comment: The conductive surface should be located where it's not exposed to physical damage or dislodgement during usual pool activities.
680.32 GFCI-Protected Receptacles. GFCI protection is required for electrical equipment associated with storable pools and 15A and 20A, 125V receptacles within 20 ft from the inside wall of a storable pool. Figure 680–38

680.40 General. Electrical installations for spas and hot tubs must comply with Part I as well.

680.41 Emergency Switch for Spas and Hot Tubs. In other than a single-family dwelling, a clearly labeled emergency spa or hot tub water recirculation and jet system shutoff must be supplied. The emergency shutoff must be readily accessible to the user and located not less than 5 ft away, but adjacent to and within sight of the spa or hot tub. Figure 680–40

680.34 Receptacle Locations. Receptacles must not be located less than 6 ft from the inside walls of a storable pool. The receptacle distance is measured as the shortest path an appliance cord would follow without passing through a wall, doorway, or window. Figure 680–39

680.42 Outdoor Installations. Electrical installations for outdoor spas or hot tubs must comply with Parts I and II of this article, except as permitted for (B) or (C).

Author's Comments:

- Either the maintenance disconnecting means required by 660.12 or a pushbutton that controls a relay located in accordance with this section can be used to meet the emergency shutoff requirement.

- The purpose of the emergency shutoff is to protect users. Deaths and injuries have occurred in less than 3 ft of water because individuals became stuck to the water intake opening. This requirement applies to spas and hot tubs installed indoors as well as outdoors.
(B) Bonding. Bonding is permitted by mounting equipment to a metal frame or base. Metal bands that secure wooden staves aren’t required to be bonded.

(C) Interior Wiring for Outdoor Spas or Hot Tubs. Any Chapter 3 wiring method containing a copper equipment grounding conductor insulated or enclosed within the outer sheath of the wiring method and not smaller than 12 AWG is permitted in the interior of a one-family dwelling for the connection to motor, heating, and control loads that are part of a self-contained spa or hot tub, or a packaged spa or hot tub equipment assembly.

Wiring to an underwater light must comply with 680.23 or 680.33.

680.43 Indoor Installations. Electrical installations for an indoor spa or hot tub must comply with Parts I and II of Article 680, except as modified by this section. Indoor installations of spas or hot tubs can be connected by any of the wiring methods contained in Chapter 3.

*Ex 2: The equipotential bonding requirements for perimeter surfaces contained in 680.26(B)(2) don’t apply to a listed self-contained spa or hot tub installed above an indoor finished floor.*

(A) Receptacles. At least one 15A or 20A, 125V receptacle must be located at least 6 ft, but not more than 10 ft, from the inside wall of the spa or hot tub. *Figure 680–41*

(1) Location. Other receptacles must be located not less than 6 ft, measured horizontally, from the inside walls of the indoor spa or hot tub.

(2) GFCI-Protected Receptacles. Receptacles rated 30A or less at 125V, located within 10 ft of the inside walls of an indoor spa or hot tub, must be GFCI protected. *Figure 680–42*

*Figure 680–42*

(3) Spa or Hot Tub Receptacle. Receptacles that provide power for an indoor spa or hot tub must be GFCI protected.

(4) Measurements. In determining the above dimensions, the distance to be measured must be the shortest path that the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

(B) Luminaires and Ceiling Fans.

(1) Elevation. Luminaires and ceiling fans within 5 ft, measured horizontally, from the inside walls of the indoor spa or hot tub must be:

(a) Not less than 12 ft above an indoor spa or hot tub if GFCI protection isn’t provided.

(b) Not less than 7½ ft above an indoor spa or hot tub if GFCI protection is provided.

(c) Luminaires and ceiling fans can be mounted less than 7½ ft above an indoor spa or hot tub, if GFCI protection is provided and the installation meets either of the following requirements:
(1) Recessed luminaires with a glass or plastic lens, nonmetallic or electrically isolated metal trim, and suitable for use in damp locations.

**Author's Comment:** See the definition of "Location Damp" in Article 100.

(2) Surface-mounted luminaires with a glass or plastic globe, a nonmetallic body, or a metallic body isolated from contact, and suitable for use in damp locations.

**C** **Switches**. Switches must be located not less than 5 ft, measured horizontally, from the inside walls of the indoor spa or hot tub. **Figure 680-43**

(4) Metal surfaces within 5 ft of the inside walls of an indoor spa or hot tub not separated from the indoor spa or hot tub area by a permanent barrier.

**Ex 1:** Nonelectrical equipment, such as towel bars or mirror frames, which aren’t connected to metallic piping, aren’t required to be bonded.

(E) **Methods of Bonding.** Metal parts associated with the spa or hot tub as described in 680.43(D) must be bonded by any of the following methods:

(1) Threaded metal piping and fittings

(2) Metal-to-metal mounting to a common frame or base

(3) A solid copper conductor not smaller than 8 AWG

**680.44 GFCI Protection.** The outlet that supplies a self-contained indoor spa or hot tub, a packaged spa or hot tub equipment assembly, or a field-assembled spa or hot tub must be GFCI protected. Because this rule applies to all outlets and not just receptacle outlets, a hard-wired indoor spa or hot tub would require GFCI protection. See the definition of "Outlet" in Article 100. **Figure 680-44**

(D) **Bonding.** The following parts of an indoor spa or hot tub must be bonded together:

(1) Metal fittings within or attached to the indoor spa or hot tub structure.

(2) Metal parts of electrical equipment associated with the indoor spa or hot tub water circulating system **unless** part of a listed self-contained spa or hot tub.

(3) Metal raceways and metal piping within 5 ft of the inside walls of the indoor spa or hot tub, and not separated from the indoor spa or hot tub by a permanent barrier.

**Author's Comment:** A self-contained spa or hot tub is a factory-fabricated unit that consists of a spa or hot tub vessel with water circulating, heating, and control equipment integral to the unit. A packaged spa or hot tub equipment assembly is a factory-fabricated unit that consists of water circulating, heating, and control equipment mounted on a common base intended to operate a spa or hot tub [680.2].
680.51 Luminaires, Submersible Pumps, and Other Submersible Equipment.

(A) GFCl Protection for Fountain Equipment. GFCl protection is required for luminaires, submersible pumps, and other submersible equipment must be GFCl protected, unless listed for operation at low voltage contact limit or less and supplied by a transformer or power supply that complies with 680.23(A)(2).

(C) Luminaire Lenses. Luminaires must be installed so the top of the luminaire lens is below the normal water level unless listed for above-water use. Figure 680–46

(B) Other Units. GFCl protection isn’t required for a field-assembled spa or hot tub rated three-phase or that has a voltage rating over 250V, or has a heater load above 50A.

(C) Combination Pool and Spa or Hot Tub. GFCl protection isn’t required for equipment that supplies a combination pool/hot tub or spa assembly.

PART V. FOUNTAINS

680.50 General. The general installation requirements contained in Part I apply to fountains. In addition, fountains that have water common to a permanently installed pool must comply with Part I and Part II of this article.

Author’s Comment: A “Fountain” is defined as an ornamental, display, or reflection pool [680.2].

680.53 Bonding. Metal-piping systems associated with the fountain must be bonded to the circuit equipment grounding conductor of the branch circuit that supplies the fountain equipment.
680.55 Methods of Equipment Grounding.

(B) Supplied by a Flexible Cord. Equipment supplied by a flexible cord must have exposed metal parts connected to an insulated copper equipment grounding conductor that's an integral part of the cord.

680.56 Cord-and-Plug-Connected Equipment.

(B) Cord Type. Flexible cords immersed in or exposed to water must be of the hard-service type, as designated in Table 400.4, and must be marked “Water-Resistant.”

680.57 Signs in or Adjacent to Fountains.

(B) GFCI Protection of Sign Equipment. Each circuit that supplies a sign installed within a fountain, or within 10 ft of the fountain edge, must be GFCI protected [680.57(A)]. Figure 680–47

680.58 GFCI-Protected Receptacles. GFCI protection is required for 15A and 20A, 125V through 250V receptacles located within 20 ft of the inside walls of a fountain. Figure 680–48

PART VII. HYDROMASSAGE BATHTUBS

680.70 General. A hydromassage bathtub is only required to comply with the requirements of Part VII; it's not required to comply with the other parts of this article.
680.72 Other Electrical Equipment. Luminaires, switches, receptacles, and other electrical equipment located in the same room and not directly associated with a hydromassage bathtub must be installed in accordance with Chapters 1 through 4.

Author's Comment: A hydromassage bathtub is treated like a regular bathtub. For example, a 5 ft clearance isn’t required for switches or receptacles, and the fixtures must be installed in accordance with 410.4(D). Figure 680–50

680.73 Accessibility. Electrical equipment for hydromassage bathtubs must be capable of being removed or exposed without damaging the building structure or finish. Where the hydromassage bathtub is cord-and plug-connected, the must face toward and be within 1 ft of the opening.

680.74 Equipotential Bonding. Metal piping systems and grounded metal parts in contact with the circulating water must be bonded to the hydromassage circulating pump motor that is not double insulated with an 8 AWG or larger bare solid copper conductor. Figure 680–51

Where the metal piping systems or grounded metal part in contact with the circulating water is present with a double insulated motor, an 8 AWG or larger bare copper conductor must be provided at the hydromassage circulating motor with sufficient length to terminate on a replacement non-double insulated pump motor. Figure 680–52

The metal piping to motor bonding jumper is not be required to be attached to any panelboard, service equipment, or electrode.
